Workflow for editing main Twine story via GitHub:

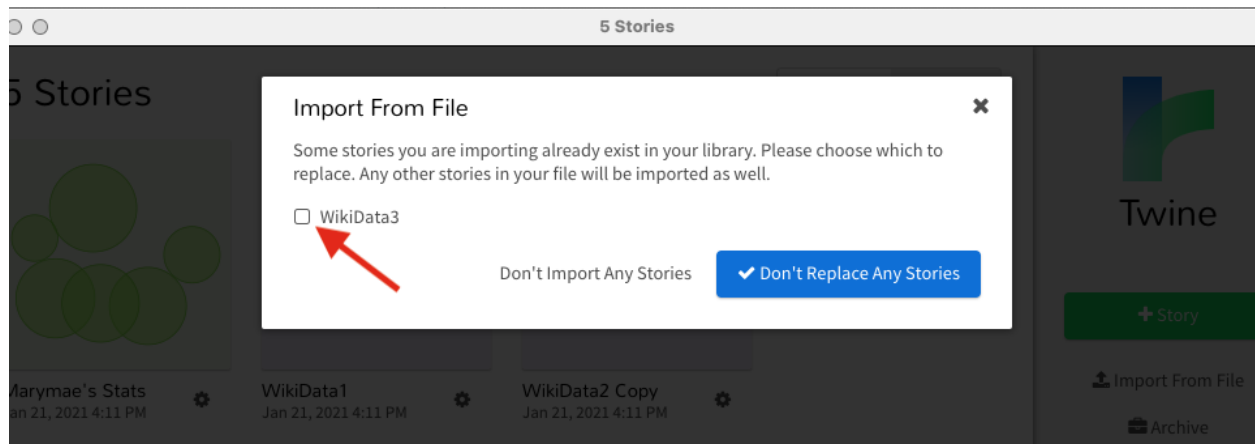

1. Open the GitHub Desktop program.
2. Click the synchronizing button at the upper right (probably labeled "Fetch origin", but changes sometimes) to make sure the local copy on the computer is synched with what's in the cloud.

3. Start the Twine program.
4. Click "Import From File"

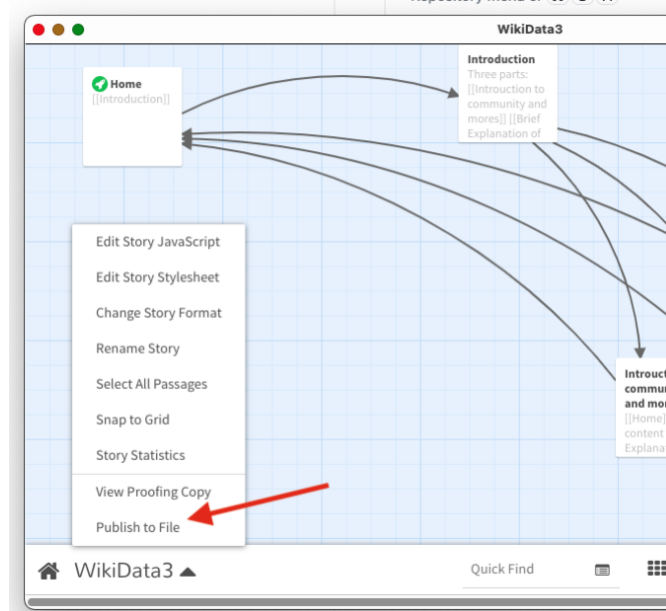

5. Navigate to the Github repository folder (twine-for-wikicite) then the docs folder. Select the "index.html" file. If it complains about the story already existing, check the "WikiData3" checkbox, then click "Replace 1 Story".

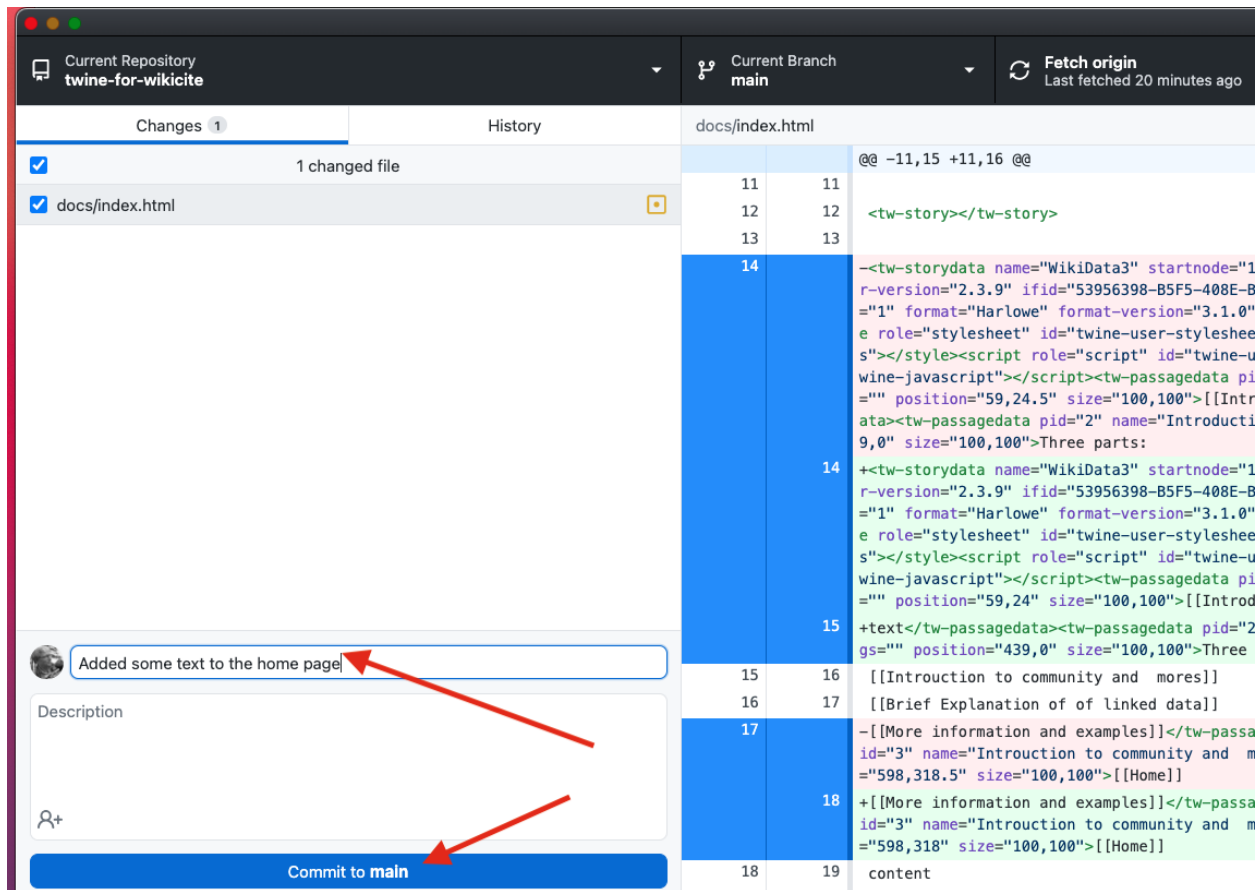

6. Open the WikiData3 story and do your editing.

7. When you are done, drop down the menu in the lower left and select "Publish to File".

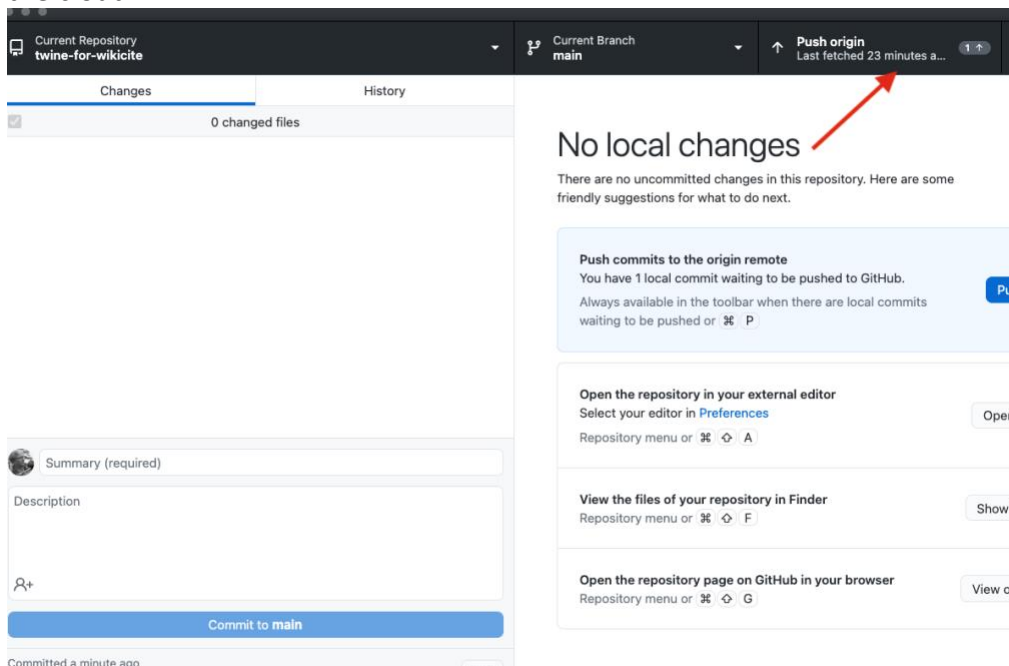

8. Save the file as index.html in the same "docs" folder you opened it from. Let it replace the file if it wants.

9. Go back to Github Desktop. Click on the left side of the screen and you should see changes to index.html. Type a commit message describing your changes, then click the "Commit to main" button.

10. Find the synchronize button on the upper right. It's label will probably have changed to "Push origin" and show a "1" with an upwards pointing arrow. Click it to push the changes to the cloud.

11. To check if your changes worked, go to the test page URL:  
<https://heardlibrary.github.io/twine-for-wikicite/> . This link is also on the landing web page (readme.md) for the repository ) <https://github.com/HeardLibrary/twine-for-wikicite>.
